A ceramic is any of the various hard, brittle, heat-resistant and corrosion-resistant materials made by shaping and then firing a nonmetallic mineral, such as clay, at a high temperature. Common examples are earthenware, porcelain, and brick.. The crystallinity of ceramic materials ranges from highly oriented to semi-crystalline, vitrified, and often completely amorphous (e.g., glasses).

XRD patterns of commercial melted glass and wet synthesized inorganic polymer were compared showing broad peaks between 17 and 34 2 θ (typical for amorphous phases) which for inorganic polymer is slightly shifted to the higher 2 θ revealing questioningly its relatively more “dense” structure than that for analogous commercial glass.

Special glassy materials and their properties

Acrylic glass, poly(methyl methacrylate), is a polymer, fitting the description of glass by being an amorphous solid. Acrylic glass has a very similar refractive index to silica glass (~1.5) and is physically lighter, softer, and more shatter-resistant than glass. [3] Polycarbonates is another class of optically transparent polymers.

Thus the inclusion of materials in this volume is selective rather than exhaustive. In the case of commercial optical glasses, for example, properties of representative types of glasses are given but not properties for all compositional variations. Glasses with special properties or for special applications are included, however.
