Microcontroller. Microprocessor. It is a mini-computer capable of performing a task on its own. Examples: 8051, 8951 etc. It is the central processing unit of the computer. Examples: 8085, 8086 etc. It has necessary peripherals inside the chip like RAM, ROM, etc that is why it is called SoC (system on chip).

Difference Between Microprocessor and Microcontroller

One big difference between a microprocessor and an application processor is their physical packaging. Many microprocessors are standard ICs with a standard part number. In contrast, mobile application processors are more typically systems on a chip (SoC) that incorporate the IP of one or more processor cores along with other ancillary functions.

The term microprocessor and microcontroller have always been confused with each other. Both of them have been designed for real time applications. They share many common features and at the same time they have significant differences. Both the IC's – i.e., the microprocessor and microcontroller – cannot be distinguished by looking at them.

Difference between Microprocessor and Microcontroller

A microcontroller (μC or uC) is a solitary chip microcomputer fabricated from VLSI fabrication. A micro controller is also known as embedded controller. Today various types of microcontrollers are available in market with different word lengths such as 4bit, 8bit, 64bit and 128bit microcontrollers. Microcontroller is a compressed micro computer manufactured to control the functions of embedded systems in office machines, robots, home appliances, motor vehicles, and a number of other gadgets.
