After combining your like terms, construct an expression from your new, smaller set of terms. You should get a simpler expression that has one term for each different set of variables and exponents in the original expression. This new expression is equal to the first. In our example, our simplified terms are $6x$ and -2 , so our new expression is $6x - 2$. This simplified expression is equal to the original $(1 + 2x - 3 + 4x)$, but is shorter and easier to manage.
