Introduction.

Esterification is a chemical reaction that occurs between an acid, usually a carboxylic acid, and an alcohol or other compound containing a hydroxyl group that results in an ester. 1 Esterification reactions typically proceed in five distinct steps.

Benzocaine is structurally analogous to Cocaine, Lidocaine, and Novocaine (shown below) and is prepared by the esterification of p -aminobenzoic acid with ethanol. 1 Note that esterification reactions can be significantly influenced by the concentration of starting materials and products in solution, as explained by Le Chatelier's Principle. 1.

.-2 Abstract: This report presents the process of producing an ester, specifically isopleths acetate. Esters are derivatives of carboxylic acids in which the call carbon bears an alkyl substitutes (-OR) instead of the hydroxyl substitutes (-OH) of the acid. Esters tend to have pleasant, fruity odors.

Lab Report 10 - Esterification: Preparation of Methyl Benzoate The purpose of this lab was to generate an ester through acid-catalyzed esterification of a carboxylic acid with an alcohol, a process known as Fischer esterification. An ester is a derivative of a carboxylic acid. There are many ways to make esters.

EXPERIMENT 5 ORGANIC SYNTHESIS: FISCHER ESTERIFICATION

In this practical, students explore the formation of esters through the ability of different alcohols to react with organic acids. Together, the class can quickly produce a range of esters on a test tube scale, with a variety of interesting smells to sample and compare. As a class experiment this can be organised, if desired, as a class-cooperative investigation of the ability of a range of alcohols to react with a range of organic acids.

The esterification

reaction is a term for a general reaction in which two reactants, an alcohol and an acid, form an ester in the final product². This reaction can be used to synthesize aspirin from salicylic acid. These types of reactions are typically reversible, so most esterification reactions are equilibrium reactions.

Esters mainly result from the condensation (a reaction that produces water) of a carboxylic acid and an alcohol. The process is called esterification. This reaction can be catalyzed by the presence of H^+ ions. Sulphuric acid, H_2SO_4 , is often used

as a catalyst for this reaction. Esters have the general formula $R-COOR$.

The purpose of this experiment is aimed at synthesizing 3-methylbutyl acetate (isopentyl acetate) via an esterification process between isopentyl alcohol (3-methylbutanol) and acetic acid with concentrated sulfuric acid as the catalyst. The process has been made using a reflux apparatus, a separatory funnel, drying agents, and simple distillation to obtain its boiling point, and separate the product.

Introduction. A carboxylic acid will react with an alcohol to form an ester and water in a reversible reaction (i. e., the ester will react with water to form a carboxylic acid and an alcohol). 2 The forward and reverse processes will proceed until there is no net change in the amount of each chemical species, which is when

we say that chemical equilibrium has been attained.

Lab 6: Fischer Esterification Purpose: The purpose of "Experiment 6: Fischer Esterification" is to synthesize isopentyl acetate by reacting isopentyl alcohol with acetic acid in the presence of sulfuric acid. Theory: Fischer esterification is a common way of

generating an ester from a carboxylic acid. When a carboxylic acid is treated with an alcohol and an acid catalyst, the ester is formed, along with water as a byproduct.

This experiment clearly verified that you can make aspirin via esterification, and that we were able to determine a percent yield as a lab group. Clearly, acetic anhydride (alcohol) reacts with salicylic acid (acid) to yield the ester (aspirin), as was shown by the crystals that formed and dried over a week that measured in at 2.28g.

Esters have a hydrocarbon group of some sort replacing the hydrogen in the -COOH group of a carboxylic acid. We shall just be looking at cases where it is replaced by an alkyl group, but it could equally well be an aryl group (one based on a benzene ring). A common ester - ethyl ethanoate The most commonly discussed ester is ethyl ethanoate.
