The Bainbridge reflex, also called the atrial reflex, is an increase in heart rate due to an increase in central venous pressure. Increased blood volume is detected by stretch receptors (Cardiac Receptors) located in both sides of atria at the venoatrial junctions.

Cardiology development raises new questions about mechanisms governing the circulatory system. Integration of these fields is a main goal of the conference “Cardio-pulmonary reflex control”, which will take place in Wroclaw at 14 th and 15 th of May 2019. The international conference “Cardio-pulmonary reflex control”, organized by Physiology Department of Wroclaw Medical University and CasusBTL Group, is a great opportunity to discuss physiology and cardiology innovations in the ...

Physiology meets cardiology: cardio-pulmonary reflex control

Background: A growing body of evidence relates the release during cardiopulmonary bypass (CPB) of proinflammatory cytokines, such as tumor necrosis factor-alpha, interleukin (IL)-6, and IL-8, to the postoperative systemic inflammatory response syndrome. Antiinflammatory cytokines, such as IL-10, however, may also play an important role in limiting these complications.

Cytokine responses to cardiopulmonary bypass: lessons ...

Cytokines are believed to be important mediators in the systemic response to cardiac surgery and CPB. The most important cytokines in this regard are interleukin (IL)-1 β , tumor necrosis factor (TNF)- α , IL-6, and IL-8, which are detectable in peripheral blood in the immediate postoperative period.

Tissue Injury and the Inflammatory Response to Pediatric ...

Abstract Background: Cardiopulmonary bypass (CPB) is often associated with degrees of complex inflammatory response mediated by various cytokines. This response can, in severe cases, lead to systemic hypotension and organ dysfunction. Cytokine removal might therefore improve outcomes of patients undergoing cardiac surgery.

The ability of UFP to stimulate the release of substance P and single walled carbon nanotubes to modify cardiac reflex function establishes the activation of sensory receptors as a possible mechanism by which UFP and NP inhalation could lead to cardiovascular effects via cardiopulmonary reflexes. Autonomic contribution to cardiac function has been well studied after PM exposure.

Objective: Proinflammatory cytokines, such as interleukin-6 (IL-6), and soluble adhesion molecules, such as E-selectin, may play an important role in patient response to cardiopulmonary bypass (CPB). We sought to define whether the heart and the lungs serve as important sources of these inflammatory mediators under clinical conditions of myocardial revascularization using CPB and cardioplegic arrest.

The main reflex responses originate from aortic arch and carotid baroreceptors (SNS inhibition), cardiopulmonary baroreceptors (diverse reflexes including the Bezold-Jarisch reflex, SNS inhibition), cardiovascular-low threshold poly-modal receptors (SNS activation), and peripheral chemoreceptors (SNS activation) .
