We can see that centripetal force and Velocity squared are also proportional. v squared by r is equal to centripetal acceleration so we can say that Centripetal force is Proportional to Centripetal acceleration where m is the constant. $F_c = mAc$. The slope of F_c/v^2 is basically m which represents the mass/ r which is the radius

A centripetal force is a force that makes a body follow a curved path. Its direction is always orthogonal to the motion of the body and towards the fixed point of the instantaneous center of curvature of the path. Isaac Newton described it as "a force by which bodies are drawn or impelled, or in any way tend, towards a point as to a centre". In Newtonian mechanics, gravity provides the centripetal force causing astronomical orbits. One common example involving centripetal force is the case in wh

Centripetal force is equal to mv^2/r , where m is body mass, v is tangential velocity and r is the curve radius. Hamill, Murphy & Sussman (1987) have measured GRF during distance running on curves equivalent to an outdoor 400 m track and for $v = 6.3$ m/s (corresponding to a mile time of 4:15.00) the peak centripetal GRF is ~ 0.6 BW. Accordingly, an athlete must run slower on a curved path to maintain the same metabolic energy expenditure.
