Failure can occur as slides, cracks and slope movement. Erosion control is intended to provide surface slope stability to protect the face of the slope and to strengthen portions of the slope below the surface by interlocking soil particles with a complex matrix of roots. There are differences between stabilization and erosion control.

slope stability and stabilization. Visual Slope's slope stability module is developed based on the widely accepted limit equilibrium theory. Visual Slope V7 also includes the finite element method (FEM) that will provide more accurate results. Soil nails/anchors have been widely used to provide reinforcement for failing soil, rock or mixed slopes. Visual Slope can be used not only for evaluation of a stabilized slope, but also for wall facing design.

Screw anchors in soil act as bearing devices for earth stabilization as opposed to driven anchors, which rely on friction between the soil and grout. This soil stabilization equipment's speed and bearing mode can beat the delays and costs of traditional methods while providing soil slope stability.
