As bounding boxes are independently generated, the layout of a full partition can be quite flexible, allowing for a simple description of those regions with complicated patterns. As a result, the RBP is able to use fewer blocks (thereby providing a more parsimonious expression of the model) than those cutting-based partition models while achieving a similar modelling capability.

Bounding volume hierarchies (BVHs) are an approach for ray intersection acceleration based on primitive subdivision, where the primitives are partitioned into a hierarchy of disjoint sets. (In contrast, spatial subdivision generally partitions space into a hierarchy of disjoint sets.) Figure 4.2 shows a bounding volume hierarchy for a simple scene. Primitives are stored in the leaves, and each node stores a bounding box of the primitives in the nodes beneath it.

The Partition SOP places points and primitives into groups based on a user-supplied rule. For example, in order to put each point in its own group named `pt_pointnumber`, enter the rule `pt_$PT`. The rule can be any valid Houdini expression. Rules should evaluate to valid group names.

On the Map Partitions page, under Range, select either Left boundary or Right boundary to specify whether to include the highest or lowest bounding value within each filegroup you create. You must always enter one extra filegroup in addition to the number of filegroups specified for the boundary values when you are creating partitions.
