Analysis With Supercritical Fluids Extraction

Supercritical fluid extraction (SFE) allows a part of a sample to be transferred to the next separation step, depending on the density of the fluid, the temperature and the addition of a modifier. The sample transfer from the supercritical state is more easily adaptable to coupled systems than from a sample in the liquid state, owing to the high volatility of the fluid at atmospheric pressure.

The most common fluid applied in SFC and SFE is carbon dioxide. The advantages of supercritical CO , such as having dif 2 fusivity like a gas and solvating power depending on temperature and pressure, are also valid for other fluids and modified fluids. Both properties are valuable for sample extraction and extraction selectivity.

Supercritical fluid chromatography is a form of normal phase chromatography that uses a supercritical fluid such as carbon dioxide as the mobile phase. It is used for the analysis and purification of low to moderate molecular weight, thermally labile molecules and can also be used for the separation of chiral compounds. Principles are similar to those of high performance liquid chromatography, however SFC typically utilizes carbon dioxide as the mobile phase; therefore the entire chromatographic

Today, supercritical fluids applications are efficiently used in industry in :

Supercritical Fluid Applications

Supercritical fluids based processes include extraction,impregnation, particle formation, formulation, sterilization,cleaing and chemical reactions among others. In all cases, thesupercritical fluid is used as an alternative to traditional organicliquid solvents. The most widely used supercritical fluids are CO2(Tc = 31°C, Pc = 74 bar) and water (Tc = 374°C, Pc = 221 bar)but some processes (extraction, reactions) involve the use ofsupercritical methanol, ethanol, propane, ethane mainly.
