Filter presses and belt filters account for a large proportion of the world's solid-liquid filtration activity, and have developed to become larger, more sophisticated and also more reliable. They are now found in applications ranging from small-scale, ultra clean medical laboratory applications through to the largest, dustiest and heaviest applications of filtration anywhere.

Separating solids from liquids - filtration - Separating ...

The basic requirements for filtration are: (1) a filter medium; (2) a fluid with suspended solids; (3) a driving force such as a pressure difference to cause fluid to flow; and (4) a mechanical device (the filter) that holds the filter medium, contains the fluid, and permits the application of force. The filter may have special provisions for removal of the filter cake or other solid particles, for washing the cake, and possibly for drying the cake.

Solid-Liquid Filtration | ScienceDirect

Filtration is a process used to separate solids from liquids or gases using a filter medium that allows the fluid to pass through but not the solid. The term "filtration" applies whether the filter is mechanical, biological, or physical. The fluid that passes through the filter is called the filtrate. The filter

medium may be a surface filter, which is a solid that traps solid particles, or a depth filter, which is a bed of material that traps the solid.
