Wind power intermittency represents one of the major challenges facing the future growth of grid-connected wind energy projects. The integration of wind turbines and energy storage systems (ESS) provides a viable approach to mitigate the unfavorable impact on grid stability and power quality. In this study, an economic model predictive control (MPC) framework is presented for an integrated wind turbine and flywheel energy storage system (FESS).

Economic nonlinear model predictive Control (EMPC) of ORC is proposed. • EMPC can maximize the

heat recovery from the drastically varying heat source. • The gradient of the EMPC objective is used to improve the computation. • Performances of different control strategies for ORC are compared. • The required power output is easy to track by EMPC.

It also suggests that economic predictive success is always likely to be limited. As a result, it is argued that a model's pragmatic qualities are relatively more important than they would otherwise be, that a theoretical framework is invaluable for motivating economic models and for directing research activities, and that actuaries should aim to develop models with shorter time horizons.
