Geometric Algebra For Computer Science

Geometric algebra is a consistent computational framework for
 geometric programming. It has new, geometrically meaningful
 products to calculate directly with the subspaces of a vector
 space. This capability considerably reinforces and extends the

linear algebra techniques traditionally used in computer graphics
 and robotics.

Geometric Algebra For Computer Science

Geometric Algebra for Computer Science (Revised Edition)
 presents a compelling alternative to the limitations of linear
 algebra. Geometric algebra (GA) is a compact, time-effective, and
 performance-enhancing way to represent the geometry of 3D
 objects in computer programs. This book explains GA as a natural
 extension of linear algebra and conveys its significance for 3D
 programming of geometry in graphics, vision, and robotics.

Geometric Algebra For Computer Science

In geometric algebra, you can use a unit vector a as a reflection
 operator by employing it in a sandwiching product: $a x a$ reflects
 the vector x in the line of a . It then follows from the figure that
 the geometric product of two unit vectors $R = b a$ fully encodes
 the rotation as a double reflection.

Almost all chapters of the book contain drills, structural exercises and programming exercises. When we wrote the drills and exercises for Geometric Algebra for Computer Science, we intended them to be for self-study. As such, we are tempted to release solutions to all the drills and structural exercises.

Geometric Algebra For Computer Science

Using geometric algebra, any k -dimensional linear subspace can be represented as a computational element called a blade, and you won't need the lookup tables anymore because equations will become intuitive, simple and generic. In geometric algebra, blades are constructed using the outer product (denoted $\wedge$).

Geometric algebra provides a rich and general mathematical framework for the development of solutions, concepts and computer algorithms without losing geometric insight into the problem in question. Many current mathematical subjects can be treated in an unified manner without abandoning the mathematical system of geometric algebra, such as multilinear algebra, projective and affine geometry, calculus on manifolds, Riemann geometry, the representation of Lie algebras and Lie groups using ...

Such extended geometrical entities are now basic elements of algebraic computation. We use the blades of a geometric algebra to algebraically represent all geometrical primitives. The scalars in a vector space are represented as 0-blades, the vectors by 1-blades, and the oriented area elements are 2-blades.
