A secondary explosion due to flame propagation through vessel interconnections is one of the most overlooked risks that companies miss when assessing explosion protection for their processes. If left unchecked, a dust or vapor deflagration initiating in one process equipment can become a more serious and often uncontrolled event in other connected vessels.

Controlling Flame Propagation through Active and Passive ...

Deflagration (Lat: de + flagrare, "to burn down") is subsonic combustion propagating through heat transfer; hot burning material heats the next layer of cold material and ignites it. Most "fires" found in daily life, from flames to explosions such as that of black powder, are deflagrations.

Deflagration - Wikipedia

The main mechanism of combustion propagation is of a flame front that moves forward through the gas mixture - in technical terms the reaction zone (chemical combustion) progresses through the medium by processes of diffusion of heat and mass. In its most benign form, a deflagration may simply be a flash fire .

Flame Propagation And Deflagration To Detonation

Deflagration is an explosion in which the speed of burning is lower than the speed of sound in the surroundings." Everyday fire and most controlled explosions are examples of deflagration. The flame propagation velocity is less than 100 meters per second (usually much lower), and the overpressure is less than 0.5 bar.

The Difference Between Deflagration and Detonation

Deflagrations and detonations. A deflagration occurs when a flame front propagates by transferring heat and mass to the unburned air-vapor mixture ahead of the front. The combustion wave travels at subsonic speeds to unburned gas immediately ahead of the flame front.

Deflagration - an overview | ScienceDirect Topics

This flame propagation mode is the canonical deflagration wave that features a unique flame speed, S_L , as an eigenvalue of the flame. However, when the fresh mixture is already pre-heated and thus auto-igniting at the inlet, the back-diffusion may not control the flame propagation and the flame may propagate in an arbitrary speed larger than S_L . Note that a mixture is considered auto-igniting here if the residence time of the mixture ahead of the flame front is comparable to or longer ...

It is revealed that the entire flame propagation process of the case without jet can be divided into four distinct phases: the initial flame core, the flame with bifurcated front, the finger flame and the fast deflagration flame. Since the depth on an arrester is specified for certain conditions, changes in the temperature, pressure, or composition of the gases entering the arrester can cause the flame spatial velocity to increase, making the design of the arrester insufficient to stop the flame front ("propagation"). The deflagration may continue downstream of the arrester.

Flame arrester - Wikipedia

When a deflagration occurs, the pressure preceding the flame front causes the internal flap plate to

close, creating a mechanical barrier to stop flame propagation upstream. A latching mechanism is required to prevent "bounce" that could allow flame to pass.

Stop Explosion Propagation | Chemical Processing

The flame speed is the measured rate of expansion of the flame front in a combustion reaction. The flame is generally propagated spherically and the radial flame propagation velocity is defined as the flame speed. In other words, flame speed represents how rapidly the flame travels from an absolute reference point, while burning velocity presents the moving rate of chemical reactants (unburned ...

The deflagration flame structure is coherent in the propagation pattern, and there is no obvious fault. Since 148 ms after ignition, the flame becomes brighter, and a large area of bright yellow flame are generated in the upper part of duct, which means that deflagration intensity increases gradually.

A deflagration, in general, is the mode of flame propagation which is determined largely by heat conduction and molecular diffusion of heat and species. Heat is generated by chemical reaction in combustion and transported ahead of the reaction zone into an unburnt zone for preheating.
