Water cooled chillers. Pros. Water cooled chillers are more efficient, especially for large cooling loads, they use the evaporation of water to dissipate heat which is less energy intensive than blowing air across a hot surface like air cooled chillers. Water also has a higher

heat capacity than air so its inherently easier to remove the heat

Chiller Types And Application Guide - The Engineering Mindset

Chillers use a refrigerant gas to move the unwanted heat between the evaporator and the condenser. The chilled water is generated in evaporator and this is sent around the building by a pump to collect the unwanted heat and bring it back to the evaporator to be cooled down. The refrigerant collects this heat and moves it to the condenser.

In this example the chilled water flow rate is 15.8 kg/s (34.8 lbm/s). The temperature in, so that's the temperature coming in from the building after it's collected all the unwanted heat within the building, is around 12°C (53.6°F). The water temperature coming out will be around 6°C (42.8°F). That means the heat transfer for that would be 397 kW. You can check that as well by ...
