When the vertex of the angle is on the circle, at the intersection of two chords, or of one chord and one tangent, the angle is called an inscribed angle.

Remember from the last lesson that such an angle has only one intercepted arc, and that the measure of the angle is half the measure of its intercepted arc.

Intersecting secant and tangent line with vertices on ...

A line intersecting a circle in two places is referred to as a secant. The portion of the secant contained within the circle is called a chord. If a line intersects a circle at only a single point, it is called a tangent. The point at which it intersects with the

circle is referred to as the point of tangency. A tangent is always perpendicular to the radius of the circle at the point of tangency.

Theorems: If two chords intersect in a circle, the product of the lengths of the segments of one chord equal the product of the segments of the

other. Intersecting Chords Formula:

(segment piece) x (segment piece) = (segment piece) x (segment piece)

Formula: $a \cdot b = c \cdot d$.

The intersection of tangents and secants

creates three distinct relationships or scenarios. The same is true when two secants or two chords intersect. The distinguishing characteristic between each case lies in where the intersection happens.

Intersecting Secants Theorem (Explained w/ 15 Examples!)

Segments of Chords Secants Tangents. In Figure 1, chords QS and RT intersect at P. By drawing QT and RS, it can be proven that $\triangle QPT \sim \triangle RPS$. Because the ratios of corresponding sides of similar triangles are equal, $a / c = d / b$. The Cross Products Property produces $(a)(b) = (c)(d)$. This is stated as a theorem.

Secants Tangents - CliffsNotes

Students learn the following theorems related to chords, secants, and tangents. The measure of an angle formed by two chords that intersect inside a circle is equal to half the sum of the measures of the intercepted arcs.

Angles formed by Chords, Secants, and Tangents

Theorem 22: If a chord and a tangent intersect externally, then the product of the length of the segments of the chord is equal to the square of the length of the tangent from the point of contact to the point of intersection. Given: Chord and tangent of a circle intersect each other at point P outside the circle. To Prove: Proof:

If two chords intersect inside a circle, then the product of the lengths of the segments of one chord is equal to the product of the lengths of the segments of the other chord. If two secant segments are drawn to a circle from an external point, then the product of the lengths of one full secant segment and its external tangent segment is equal to the product of the lengths of the other full secant segment and its external tangent segment.

Segments formed by Chords, Secants, and Tangents

An angle formed by a

chord (link) and a tangent (link) that intersect on a circle is half the measure of the intercepted arc . $x = \frac{1}{2} \cdot m. \angle ABC$. Note: Like inscribed angles, when the vertex is on the circle itself, the angle formed is half the measure of the intercepted arc.

Circles: The Angle formed by a Chord and A Tangent ...

That is, if the endpoints of one chord are the endpoints of one arc, then the two arcs defined by the two congruent chords in the same circle are congruent. Intersecting Chords, Tangents, and Secants A number of interesting theorems arise from the relationships between chords, secant segments, and tangent segments that

intersect.

This investigation proves Theorem 9-11. Theorem 9-11: The measure of an angle formed by a chord and a tangent that intersect on the circle is half the measure of the intercepted arc. From Theorem 9-11, we now know that there are two types of angles that are half the measure of the intercepted arc; an inscribed angle and an angle formed by a chord and a tangent.

Two circles intersect each other at point A and B. A straight line PAQ cuts the circle at P
