CUDA C/C++ Streams and Concurrency - Nvidia

CUDA Streams. A stream in CUDA is a sequence of operations that execute on the device in the order in which they are issued by the host code. While operations within a stream are guaranteed to execute in the prescribed order, operations in different

streams can be interleaved and, when possible, they can even run concurrently. The default stream. All device operations (kernels and data transfers) in CUDA run in a stream.

As the section “Implicit Synchronization” in the CUDA C Programming Guide explains, two commands from different streams cannot run concurrently if the host thread issues any CUDA command to the default stream between them. CUDA 7 introduces a new option, the per-thread default stream, that has two effects. First, it gives each host thread its own default stream.

From here on unless I state otherwise, I will use the term “CUDA C” as shorthand for “CUDA C and C++”. CUDA C is essentially C/C++ with a few extensions that allow one to execute functions on the GPU using many threads in parallel. CUDA Programming Model Basics. Before we jump into CUDA C code, those new to CUDA will benefit from a basic description of the CUDA programming model and some of the terminology used.

An Easy Introduction to CUDA C and C++ - NVIDIA Developer
CUDA C++ extends C++ by allowing the programmer to define

C++ functions, called kernels, that, when called, are executed N times in parallel by N different CUDA threads, as opposed to only once like regular C++ functions.. A kernel is defined using the `__global__` declaration specifier and the number of CUDA threads that execute that kernel for a given kernel call is specified using a new ...

Best How To : You should read section J.2.2 of the programming guide (and preferably all of appendix J).. With Unified Memory, memory allocated using `cudaMallocManaged` is by default attached to

all streams ("global") and we must modify this in order to make effective use of streams, e.g. for compute/copy overlap. We can do this with the `cudaStreamAttachMemAsync` function as described in section ...

According to the CUDA programming guide, a stream is a sequence of commands (possibly issued by different host threads) that execute in order. Different streams, on the other hand, may execute their commands out of order with respect to one another or concurrently. This is exactly what we want to implement the concurrent model for our CUDA programs. Default Stream

seem to be empty each time i look inside it. In the beginning my plan was to use 2 streams, but I couldn't access the texture, so I reduced the number of streams to 1 (for debugging), reduced the kernel to 1 block of 1 thread, as you can see below.
