Plasma Material Interaction In Controlled

Plasma-Material Interaction in Controlled Fusion deals with the specific contact between the fourth state of matter, i.e. plasma, and the first state of matter, i.e. a solid wall, in controlled fusion experiments. A comprehensive analysis of the main processes of plasma-surface interaction is given together with an assessment of the most critical questions within the context of general criteria and operation limits.

The plasma can erode, transport and redeposit the wall material, while the plasma ions can embed and be trapped in defects and voids in the material. This can lead to strong morphological changes in the material as well as being a concern to maintain the fuel cycle.

Studying Interaction of Plasma with

Irradiated Tungsten and Tungsten Alloys in Fusion Devices. Controlled nuclear fusion is widely accepted as one of the best long-term hopes for meeting the world's energy needs. After 70 years of research, the construction of ITER and the proliferation of smaller experiments, some of them commercial enterprises, mark a significant step towards the realization of these hopes.
