Topological Indices For Medicinal Chemistry

In the fields of chemical graph theory, molecular topology, and mathematical chemistry, a topological index also known as a connectivity index is a type of a molecular descriptor that is calculated based on the molecular graph of a chemical compound. Topological indices are numerical parameters of a graph which characterize its topology and are usually graph invariant.

Topological indices (TIs) are numerical representations of the topology of a molecule, and are calculated from the heavy atom graphical depiction of the molecule. One of the first TIs was that of Wiener in 1947, who showed that his index correlated well with the boiling points of alkanes. There are now many different TIs available, and many of them are discussed in this chapter, with respect largely to their use as descriptors in QSAR/QSPR modeling.

The numerical encoding of chemical structure with Topological Indices (TIs) is currently growing in importance in Medicinal Chemistry and Bioinformatics. This approach allows the rapid collection, annotation, retrieval, comparison and mining of chemical structures within large databases. TIs can subsequently be used to seek quantitative structure-activity relationships (QSAR), which are models connecting chemical structure with biological activity.
