Solar Radiation Data From Satellite

The radiance received by satellites is related to solar radiation incident at the earth’s surface since it results from the different interactions of the sun’s radiation with the earth-atmosphere system—scattering, absorption, and reflection.

The current most accurate TSI values from the Total Irradiance Monitor (TIM) on NASA’s Solar Radiation and Climate Experiment (SORCE) is $1360.8 \pm 0.5 \text{ W/m}^2$ during the 2008 solar minimum as compared to previous estimates of $1365.4 \pm 1.3 \text{ W/m}^2$ established in the 1990s.

Abstract. Since the availability of ground data is very sparse, satellite data provides an alternative method to estimate solar irradiation. Satellite data across various spectral bands may be employed to distinguish weather signatures, such as dust, aerosols, fog, and clouds. For a tropical country like India, which is potentially rich in solar energy resources, the study of these parameters is of crucial importance from the perspective of solar energy.
