Inflection Point

Inflection points in differential geometry are the points of the curve where the curvature changes its sign. For example, the graph of the differentiable function has an inflection point at $(x, f(x))$ if and only if its first derivative, f' , has an isolated extremum at x . (This is not the same as saying that f has an extremum).

Inflection point - Wikipedia

When the second derivative is positive, the function is concave upward. When the second derivative is negative, the function is concave downward. And the inflection point is where it goes from concave upward to concave downward (or vice versa). Example: $y = 5x^3 + 2x^2 - 3x$

An inflection point is a point on a curve at which the sign of the curvature (i.e., the concavity) changes. Inflection points may be stationary points, but are not local maxima or local minima. For example, for the curve plotted above, the point is an inflection point.

Inflection Point -- from Wolfram MathWorld

An inflection point is a point on a curve at which a change in the direction of curvature occurs. For instance if the curve looked like a hill, the inflection point will be where it will start to look like U. Formula to calculate inflection point. We find the inflection by finding the second derivative of the curve's function.

How to Calculate Inflection Point.

An inflection point (sometimes called a flex or inflection) is where a graph changes curvature, from concave up to concave down or vice versa. A concave up graph is like the letter U (or, a "cup"), while a concave down graph is shaped like an upside down U, or a Cap (n). The inflection point happens when a "cup" and a "cap"

meet.
