a large class of M/G/1 priority queues, due to Kleinrock [7]. We focus in particular on accumulating priority queues, in which a customer's priority is the product of their current waiting time and some constant determined by their priority class. This queue allows customers to overtake each other in priority.

Queue with Markov arrival process, general service time distribution and one server In queueing theory, a discipline within the mathematical theory of probability, an M/G/1 queue is a queue model where arrivals are Markovian, service times have a General distribution and there is a single server. The model name is written in Kendall's notation, and is an extension of the M/M/1 queue, where service times must be exponentially distributed. The classic application of the M/G/1 queue is to model per

This note deals with a mean-value approach for M/G/1 priority queues. Using the residual life-time formula, Little's formula and the fact that Poisson arrivals see time averages, we derive schemes to evaluate mean response times, mean queue lengths and mean waiting times for the respective priority classes.
