By the degree-sum formula, $mk + (n(T) - m) = 2n(T) - 2$, since T has $n(T) - 1$ edges. The equation simplifies to $n(T) = m(k - 1) + 2$. Since m is a nonnegative integer, $n(T)$ must be two more than a multiple of $k - 1$. Whenever $n = m(k - 1) + 2$, there is such a tree (not unique for $m \geq 4$).

Graph theory has abundant examples of NP-complete problems. Intuitively, a problem is in P1 if there is an efficient (practical) algorithm to find a solution to it. On the other hand, a problem is in NP 2, if it is first efficient to guess a solution and then efficient to check that this solution is correct. It is conjectured (and not known) that $P = NP$.

Lecture Notes on GRAPH THEORY

In mathematics, graph theory is the study of graphs, which are mathematical structures used to model pairwise relations between objects. A graph in this context is made up of vertices which are connected by edges. A distinction is made between undirected graphs, where edges link two vertices symmetrically,

and directed graphs, where edges link two vertices asymmetrically; see Graph for more detailed definitions and for other variations in the types of graph that are commonly considered. Graphs a

Solution. Given a graph G of order n with degree sequence $(d_1, d_2, \dots, d_n)$, let H be the graph obtained by adding a new vertex w to G and joining w to every vertex in G (see the diagram below). It can be checked that the degree sequence of H is $(d_1 + 1, d_2 + 1, \dots, d_n + 1, n)$.
