The genetic basis of human traits can be
 discovered through analyzing the results
 of matings that have already occurred,

i.e. through pedigree analysis. Pedigrees are family trees which show the parents and offspring across generations, as well as who possessed particular traits.

In fact, geneticists often study the expression of particular traits in family lineages, or pedigrees, in order to gain insight into the mode of expression for a given character trait. Not only can pedigree analyses provide insight into the mode of transmission, but importantly, they can be used to predict the genotype of particular individuals.

Pedigree Analysis: Genetic Analysis of Humans - Biology ...

Genetics in humans cannot be studied by performing controlled crosses rather, analysis of inheritance patterns in an existing population must be used. An approach, called pedigree analysis, is used to study the inheritance of genes in humans.

The family study, which includes typing of the proband's mother, father, and all full siblings, provides an internal verification of the patient's HLA haplotypes. Because HLA genes segregate in classic Mendelian fashion, the probability that a sibling inherits the same parental haplotypes is 25% (genotypically identical). The probability that a sibling inherits one identical paternal or maternal haplotype plus one nonshared haplotype is 50% (haploidentical).

And a pedigree is a way of analyzing the inheritance patterns of a trait within a family. And it can be useful to understand more about that trait, maybe to make some insights about the genetics of that trait, and it's a way to think about what's happened in the past in a family, and then maybe we can help get some probabilities or get some understanding of what might happen in the future.
