Odds are their previous teacher taught them "cross multiply and divide!" This method of teaching ratios and proportions is no more than a trick! It shows nothing about knowing why the students are doing what they are doing. It is far more important to show them that the diagonals are equal instead. If they understand that the diagonals must be equal rather than cross multiplying and divide then they will be able to solve any proportion as they come along throughout different math classes.

But now we want to actually divide this to actually get our right answer, or a simplified answer. 8 goes into 360, 8 goes into 36 4 times, 4 times 8 is 32. You have a remainder of 4. Bring down the 0. 8 goes into 40 5 times. 5 times 8 is 40. And then you have no remainder.

Worked example: Solving proportions (video) | Khan Academy

A proportion is a name we give to a statement that two ratios are equal. It can be written in two ways: two equal fractions, or, using a colon, $a:b = c:d$; When two ratios are equal, then the cross products of the ratios are equal. That is, for the proportion, $a:b = c:d$, $a \times d = b \times c$

Ratios and Proportions - Proportions - First Glance - math

In practice, a ratio is most useful when used to set up a proportion — that is, an equation involving two ratios. Typically, a proportion looks like a word equation, as follows: For example, suppose you know that both you and your friend Andrew brought

the same proportion of scarves to caps.

Ratios and Proportions - dummies

A proportion is a statement that two ratios are equal. The proportion a / b is read as a is to b as c is to d . The first and last terms (a and d) are called the extremes, and the middle terms (b and c) are called the means. There are several useful properties involving proportions, and these properties can be established using algebra.
