Periodontal Regeneration Current Status And

One of the biggest advancements in recent years was the realization that periodontal tissues can be regenerated, rather than simply repairing the tissue after periodontal disease has occurred, and that periodontal regeneration can be enhanced with materials such as Emdogain™ and other protein products. Summary: The challenge of periodontal regeneration has become a central issue in periodontal research and practice. The objective, of course, is to reconstitute the biologic complex of cementum, periodontal ligament, and alveolar bone onto the root surfaces associated with marginal periodontitis. In this book, premier investigators and clinicians, contending that standard treatment techniques do not result in periodontal.

Periodontal Regeneration: Current Status and Directions ...

Liu et al. reported that autologous PDL- MSCs enhanced regeneration of

periodontal tissue, including alveolar bone, cementum and PDL in a minipig . Feng et al. transplanted autologous PDL progenitors to three patients who suffered from periodontal disease. The results showed periodontal regeneration with no adverse effect . Tissue engineering techniques have been applied to improve these cell-based therapies.

Periodontal ligament stem cells (PDLSCs), which reside in the perivascular space of the periodontium, possess characteristics of mesenchymal stem cells and are a promising tool for periodontal regeneration. Recently, great progress has been made in PDLSC transplantation.

Regenerative procedures are forms of treatment aimed to reconstruct the lost structure or damaged periodontal tissue. The periodontal regeneration involves a sequence of biological events including

adhesion, migration, proliferation, and differentiation [68,69]. Numerous methods of therapies have been tested to achieve periodontal regeneration.

Periodontal Regeneration - an overview | ScienceDirect Topics

Although current treatment approaches can limit the progression of the disease by controlling the inflammatory aspect, complete periodontal regeneration cannot be predictably achieved. Various tissue engineering approaches are investigated for their ability to control the critical temporo-spatial wound healing events that are essential for achieving periodontal regeneration.

Tissue Engineered Constructs for Periodontal Regeneration ...

The discovery and therapeutic application of stem cells have offered a new concept for periodontal regeneration. The current stem cell-based therapies in periodontics rely mainly on the delivery of culture-expanded cells to the periodontal defect to enhance wound healing, and many elegant studies have documented positive outcomes using either intraoral or extraoral stem cells (reviewed in 29, 30).

Concise Review: Periodontal Tissue Regeneration Using Stem ...

GTR is a treatment plan to initiate regeneration of lost periodontal tissues and prevents the development of long junctional epithelium.[11,12] The principle of GTR is based on either restitution or "healing by repair." Some authors have suggested that GTR results in healing characterized by "reparative" rather than regenerative activity.[14,15] Schüpbach et al. and Graziani et al. concluded that the healing results

obtained following GTR are regenerative.

Clinical and radiographic evaluation of periodontal ...

However, it soon became apparent that although periodontal regeneration was possible, it was difficult to achieve reliably due to a vast range of patient and operator variables. 30 More recently, the application of biological agents onto root surfaces has been shown to induce significant regeneration of damaged periodontal tissues. 31 Compared to GTR, an advantage is that biological agents are simpler to use and provide comparable — and sometimes superior — results. 32 Like GTR clinical ...
