Consider the first-order differential equation $y' = f(x, y)$, is a linear equation and it can be written in the form. $y' + a(x)y = f(x)$ where $a(x)$ and $f(x)$ are continuous functions of x . The alternate method to represent the first-order linear equation in a reduced form is $(dy/dx) + P(x)y = Q(x)$

Solutions to Linear First Order ODE's OCW 18.03SC • Rename ec 1 as C: $|x| = Ce^{-p(t)}$; $C > 0$. • Drop the absolute value and recover the lost solution $x(t) = 0$: This gives the general solution to (2) $x(t) = Ce^{-p(t)}$ where $C = \text{any value}$. (3) A useful notation is to choose one specific solution to equation (2) and call it $x_h(t)$. Then the solution (3) shows the general solution to the equation

First-order partial differential equation - Wikipedia

A General Solution of an n th order differential equation is one that involves n necessary arbitrary constants. If we solve a first order differential equation by variables separable method, we necessarily have to introduce an arbitrary constant as soon as the integration is performed. Thus you can see that a solution of a differential equation of the first order has 1 necessary arbitrary constant after simplification.
