This type of growth has been noted in Escherichia coli as it sequentially utilizes glucose and then lactose . Fast-growing pathogenic bacteria like V. alginolyticus and A. hydrophila are considered r-selected species . The rapid growth of these pathogens in intestinal mucus confirms that the intestinal tract serves as a site of growth . If these bacteria are present in the culture environment in low numbers, and given that their lag period appears to be shorter and their maximum specific ...

These characteristics are similar to cultivating other organisms including bacteria and other protozoa whose growth depends on a minimal concentration of some metabolites secreted from the cells (Raina and Ian, 2015). In contrast, inoculating a higher number of parasites would promote growth, resulting in a shorter latent period and higher number of cells obtained after the logarithmic period.

Tumors show a wide range of growth rates in vivo. In general, nonmetastatic (benign) tumors appear to grow slowly, while metastasizing (malignant) tumors proliferate rapidly and contain a large number of dividing cells. In order to analyze if there is a direct relationship between metastatic potential and growth rate (without the influence of host factors), in vitro analyses are necessary.
