Gas exchange between tissues and the blood is an essential function of the

circulatory system. In humans, other mammals, and birds, blood absorbs oxygen and releases carbon dioxide in the lungs. Thus the circulatory and respiratory system, whose function is to obtain oxygen and discharge carbon dioxide, work in tandem.

11.3 Circulatory and Respiratory Systems - Concepts of ...

The circulatory system is a complex network of vital units of the body, such as blood, blood vessels, and the heart, which allows blood to circulate nutrients, oxygen, carbon dioxide, etc. to and from the cells so that the body can properly function. Let's start this quiz; it will give you the different functions of the human circulatory system. Find out now how much do you know about it!

The Ultimate Quiz On Circulatory System In Human Body ...

How does the fetal circulatory system work? During pregnancy, the unborn baby (fetus) depends on its mother for nourishment and oxygen. Since the fetus doesn't breathe air, his or her blood circulates differently than it does after birth: The placenta is the organ that develops and implants in the mother's womb (uterus) during pregnancy.

Blood Circulation in the Fetus and Newborn

The Respiratory System. The primary function of the respiratory system is gas exchange between the external environment and an organism's circulatory system. In humans and other mammals, this exchange balances

oxygenation of the blood with the

removal of carbon dioxide and other
metabolic wastes from the circulation.
