Etch-and-rinse adhesive systems can be applied in three or two steps, always using an initial acid-etching phase on both enamel and dentin. In the three-step systems, the acid etching and rinse step is followed by the intermediate application of a primer and ends with the application of a hydrophobic resin.

Fortunately, the current era of dentistry has witnessed the development of new materials, new techniques, and new instruments that make conservative dentistry practical and ultraconservative dentistry a reality. Adhesive restorations eliminate the need for more extensive retentive preparations. Enamel-mimicking composites (both hybrid and flowable) offer long-lasting tooth structure replacement with minimum requirements for restorative bulk.

Adhesive dentistry has lessened the need for

extensive mechanical retentive features in class IV restorations. The primary retentive feature is a beveled enamel cavosurface margin of a minimum of 1.0 to 2.0 mm in length (Fig. 40.7). Beveling allows maximal bond strength and minimizes leakage by exposing the ends of the enamel rods to etching.
