Principles and Theory of Fluorescence Spectroscopy. Fluorescence is a type of luminescence caused by photons exciting a molecule, raising it to an electronic excited state. It's brought about by absorption of photons in the singlet ground state promoted to a singlet-excited state. As the excited molecule returns to ground state, emits a photon of lower energy, which corresponds to a longer wavelength, than the absorbed photon.

Fluorimetry is a type of spectroscopy which measures the emitted radiation from a substance. This radiation is one which is emitted by the substance when the electrons transit from excited state to ground state. The principle of fluorescence spectroscopy: In UV-Visible spectroscopy, the excitation wavelength is measured. But, here the emission wavelength is measured.

Fluorescence Spectroscopy Principle, Instrumentation and ...
Fluorescence spectroscopy is a type of electromagnetic spectroscopy that analyzes fluorescence from a sample. It involves using a beam of light, usually ultraviolet light, that excites the electrons in molecules of certain compounds and causes them to emit light; typically, but not necessarily, visible light. A complementary technique is absorption spectroscopy. In the special case of single molecule fluorescence spectroscopy, intensity fluctuations from the emitted light are measured from eithe

The wavelength that gives the maximum fluorescence intensity is the maximum excitation wavelength. The shape of the excitation spectrum is similar to that of the absorption spectrum (Fig. 5). The fluorescence spectrum is acquired by fixing the excitation wavelength (Ex) and scanning the emission wavelength (Em).
