The cross of these particular dihybrids produces four phenotypic classes. (Original-Deyholos-CC:AN) If the inheritance of seed color was truly independent of seed shape, then when the F 1 dihybrids were crossed to each other, a 3:1 ratio of one trait should be observed within each phenotypic class of the other trait (Figure \(\PageIndex{3}\)). Using the product law, we would therefore predict that if $\frac{3}{4}$ of the progeny were green, and $\frac{3}{4}$ of the progeny were round, then $\frac{3}{4} \times \frac{3}{4} = 9/16$ of the ...

A dihybrid cross involves a study of inheritance patterns for organisms differing in two traits. Mendel invented the dihybrid cross to determine if different traits of pea plants, such as flower color and seed shape, were inherited independently. Our objective is to understand the principles that govern inheritance of different traits in a dihybrid cross that led Mendel to propose that alleles of different genes are assorted independently of one another during the formation of gametes.
