Real-Time Embedded Systems and Applications. A real-time embedded system is a real-time computer system (hardware and software) that is part of a larger system (called a real-time system or cyber-physical system) that typically has mechanical and/or electrical parts, such as an airplane or automobile. A real-time embedded system interfaces to the external environment through sensors and actuators, as depicted in Figure 1.1.

What is a Real-Time System? •Definition 1: RT-systems are systems in which the correctness of the system behavior depends •on the logical results of the computations, and •on the physical time when these results are produced

Introduction to Real-Time Systems

Real-Time systems are classified from a number of viewpoints i.e. on factors outside the computer system and factors inside the computer system. Special emphasis is placed on hard and soft real-time systems. A missed deadline in hard real-time systems is catastrophic and in soft real-time systems it can lead to a significant loss.

Real-Time Systems

Real-time computing, or reactive computing is the computer science term for hardware and software systems subject to a "real-time constraint", for example from event to system response. Real-time programs must guarantee response within specified time constraints, often referred to as "deadlines". Real-time responses are often understood to be in the order of milliseconds, and sometimes microseconds. A system not specified as operating in real time cannot usually guarantee a response within any t

Real-time computing - Wikipedia

A real-time system is any information processing system which has to respond to externally generated input stimuli within a finite and specified period – the correctness depends not only on the logical result but also the time it was delivered – failure to respond is as bad as the wrong response!

design and development of conventional systems, but they are of very limited use in Realtime systems. The main reason is that most communication in the real world is asynchronous in nature, i.e. very few message interactions can be classified into the query response paradigm that works so well using RPCs.
