Random Variables And Probability Distributions

The probability distribution for a random variable describes how the probabilities are distributed over the values of the random variable. For a discrete random variable, x , the probability distribution is defined by a probability mass function, denoted by $f(x)$. This function provides the probability for each value of the random variable.

If random variable can only equal a finite number of values, it is a discrete random variable. Probability distribution is known as a "probability mass function" or just p.m.f. If a random variable can equal an infinite (or really really large) number of values, then it is a continuous random variable.

Definitions Probability density function. The probability density function (pdf) of an exponential distribution is $f(x) = \lambda e^{-\lambda x}$ for $x \geq 0$ and $f(x) = 0$ for $x < 0$. Here $\lambda > 0$ is the parameter of the distribution, often called the rate parameter. The distribution is supported on the interval $[0, \infty)$. If a random variable X has this distribution, we write $X \sim \text{Exp}(\lambda)$. The exponential distribution exhibits infinite divisibility.
