Abstract. The determination of forming limit curves and deformation features of AA5754 aluminium alloy are studied in this article. The robust and repeatable experiments were conducted at a warm forming temperature range of 200 °C–300 °C and at a forming speed range of 20–300 mm/s. The forming limit curves of AA5754 at elevated temperatures with different high forming speeds have been obtained.

The forming limit diagram (FLD), also known as the Keeler–Goodwin diagram, was originally derived as an experimental, semiquantitative tool to aid designers in evaluating the risks of local fracture and necking in sheet forming (Wagoner et al., 2001). It is now used frequently in failure diagnosis of sheet forming processes and has been implemented in most sheet forming simulation software.

Forming Limit Diagram - an overview | ScienceDirect Topics
A forming limit diagram, also known as a forming limit curve, is used in sheet metal forming for predicting forming behavior of sheet metal. The diagram attempts to provide a graphical description of material failure tests, such as a punched dome test. In order to determine whether a given region has failed, a mechanical test is performed. The mechanical test is performed by placing a circular mark on the work piece prior to deformation, and then measuring the post-deformation ellipse that is ge

An efficient and reliable method of forming limit diagram prediction is proposed. The method utilizes a combined experimental punch stretching tests and finite element modeling of the above tests. The method is unique in that it does not utilize experimental grid measurements. The method utilizes a recently developed and verified strain acceleration criterion for the onset of localized necking.
