Electron configurations

allow us to understand many periodic trends. Covalent radius increases as we move down a group because the n level (orbital size) increases. Covalent radius mostly decreases as we move left to right across a period because the effective nuclear charge experienced by the electrons increases, and the electrons are pulled in tighter to the nucleus.

6: Electronic Structure and Periodic Properties

...

Elements in each column have the same valence shell electron configurations, and the elements have some similar chemical properties. This is strictly true for all elements in the s and p blocks. In the d and f

blocks, because there are exceptions to the order of filling of subshells with electrons, similar valence shells are not absolute in these blocks.

We now move farther right into the 4 d subshell region of the periodic table and count over three spaces (Y, Zr, Nb) to reach Nb. The total electron configuration is thus Nb [Kr]4 d³ 5 s² (Note that the principal quantum number of the d subshell is 4 — one less than the number of the period.
