ABSTRACT. A recently completed industry study summarizes best practice guidelines for evaluating and selecting appropriate transmission line foundations with the least impact to the environment where various sensitive and difficult conditions exist. The effort is based on a review of published case studies supplemented with selected utility and consultant surveys along with the author's personal files to gather unpublished case history information.

Design of Transmission Line Structures and Foundations

Book Description. This book covers structural and foundation systems used in high-voltage transmission lines, conductors, insulators, hardware and component assembly. In most developing countries, the term "transmission structures" usually means lattice steel towers. The term actually includes a vast range of structural systems and configurations of various materials such as wood, steel, concrete and composites.

8.5 Overview of LRFD for Foundations. The basic equation for load and resistance factor design (LRFD) states that the loads multiplied by factors to account for uncertainty, ductility, importance, and redundancy must be less than or equal to the available resistance multiplied by factors to account for variability and uncertainty in the resistance per the AASHTO LRFD Bridge Design Specifications.The basic equation, therefore, is as follows: $\Sigma \eta Q \leq \phi R$.

Chapter 8 Foundation Design

An overview is presented of research at Cornell University on reliability-based design (RBD) of foundations for transmission line structures (TLS). Under sponsorship of the Electric Power Research Institute (EPRI), Empire State Electric Energy Research Corporation (ESEERCO), and others, a long-term research effort

was conducted to develop a comprehensive RBD methodology for TLS foundations in both soil and rock under uplift, compression, and lateral/moment loading.
