Floral Morphology And Reproductive Success

To document geographic variation in floral morphology, ability to produce seeds through autogamy, and reproductive success in *E. helleborine*, we sampled 13 populations from three geographic regions along a latitudinal gradient of c. 1000 km

from northern to southern Sweden. In the southernmost region, populations in dry and mesic habitats were compared.

We studied the variation on floral traits of *Narcissus cyclamineus*, a species endemic to the northwestern Iberian Peninsula. We analyzed the effect of different breeding systems and the degree of herkogamy and stigmatic exertion on female reproductive success. Results showed that, while variation on floral structures is relatively low (i.e. less than 25% for all sterile structures), CVs for ...

in reproductive success is related to variation in floral morphology (see Herrera 1993, and references therein). The results of the present study indicate that, in Petrocoptis grandiflora, flowers with larger petals are more likely to set fruit, and when they do, they produce more seeds than flowers with small petals. Similar results have been

Floral rewards are expected to directly influence pollinator behavior and consequently affect plant reproductive success, either by increasing pollinator visit frequency or pollination quality.

However, it is still not known, whether or not night-shelter as a reward for pollinators could indeed improve the plant's reproductive success.

The goals were twofold: (1) to conduct a survey of the floral and reproductive characters in the genus *Acer* with an emphasis on comparative floral morphometrics in *A. ginnala* Maxim., *A. tataricum* L., and their hybrid *A. ginnala* × *tataricum* and (2) present a compilation and phylogenetic inferences about the reproductive biology of *Acer* based on the literature. The phenotype may affect the reproductive success directly (Gómez, 2000; Strauss & Whittall, 2006; Lay et al., 2011), for example due to differences in

pollen germination or pollen loss (Song et al., 2013), or indirectly, for example due to effects on flower visitor communities. However, our data do not allow separating direct effects of the plant's phenotype from indirect pollinator-mediated effects on individual female fitness (i.e. seed set).

References. Numerous experiments have suggested that in many species higher floral display can be more attractive for pollinators, but the possibility of between-flower self-pollination, namely geitonogamy may reduce the floral longevity, the fitness of both individuals and

the offspring. In this study we investigated how phenological parameters (mainly floral display) change temporally and how they affect the female reproductive success of cymose *Iris sibirica*.
