Our recent results show that ethenocytosine (epsilon C), a noninstructional exocyclic DNA lesion induced by vinyl chloride, may have unusual mutagenic properties. To obtain more definitive experimental evidence for the observed effects, we have introduced a single epsilon C residue at a specific site of coliphage M13AB28 replicative form DNA by a "single-stranded linker-ligation" technique.

We propose that in DNA under physiological conditions, DEB alkylates the N-1 position of adenine in DNA to form N1-(2-hydroxy-3,4-epoxybut-1-yl)-adenine adducts, which undergo an S N 2-type intramolecular nucleophilic substitution and rearrangement to give 3 (minor) and 4 (major). Formation of exocyclic DEB-adenine lesions following exposure to 1,3-butadiene provides a possible mechanism of mutagenesis at the A:T base pairs.

Exocyclic alkylamino purine adducts, including N 2-ethyldeoxyguanosine, N 2-isopropyldeoxyguanosine, and N 6-isopropyldeoxyadenosine, occur as a consequence of reactions of DNA with toxins such as the ethanol metabolite acetaldehyde, diisopropylNitrosamine,

and diisopropyltriazene. However, there are few data addressing the biological consequences of these adducts when present in DNA.

Exocyclic DNA Adducts in Mutagenesis and Carcinogenesis

Acrolein is a highly reactive alpha,beta-unsaturated aldehyde and is known to react with DNA forming exocyclic acrolein-deoxyguanosine adducts (Acro-dG). These aldehyde-DNA lesions may play a role in mutagenesis, carcinogenesis, and neurodegenerative diseases. In the present work, we described the development and evaluation of a highly sensitive and selective capillary liquid chromatography nanoelectrospray isotope dilution tandem mass spectrometry method for quantitatively analyzing Acro-dG ...

DNA adducts and oncogene activation in AIA-induced tumors. Specific mutations are critical for the activation of oncogenes and inactivation of tumor suppressor genes associated with carcinogenesis (214- 216). Several studies have examined AIA-induced tumors for mutations in genes including p53, Ki-ras and Ha-ras, Apc and B-catenin (217- 230). Among the mutations detected in these genes, guanine base mutations occurred with the highest frequency, suggestive of the involvement of AIA-DNA ...
