Aircraft Engine Notes

Air cooled aircraft engines depend on one of two different baffling systems for engine cooling. The most common of these is the one where metal baffles are attached to the engine forming the side walls and back wall creating a pressurized air chamber above the engine. The top of the cowling serves as the third side of the cooling chamber.

The rotary engine was an early type of internal combustion engine, usually designed with an odd number of cylinders per row in a radial

configuration, in which the crankshaft remained stationary in operation, with the entire crankcase and its attached cylinders rotating around it as a unit. Its main application was in aviation, although it also saw use before its primary aviation role, in a few early motorcycles and automobiles. This type of engine was widely used as an alternative to convention

Chemical energy of the fuel is first converted to thermal energy by means of combustion or oxidation with air inside the engine, raising the T and p of the gases within the combustion chamber. The high-pressure gas then expands and by mechanical mechanisms rotates the crankshaft, which is the output of the engine.

A gas generator that drives a propeller is a turboprop engine. The expansion of gas through the turbine supplies the energy required to turn the propeller. A schematic diagram of the turboprop is shown in Fig. 1.8. The turboshaftengine is similar to the turboprop except that power is supplied to a shaft rather than a propeller.
