Then circular Hough transform is applied to detect the inner and outer boundaries of the iris. The circular Hough transform is employed to deduce the radius and centre coordinates of the pupil and iris regions. In this operation, the radius intervals are defined for inner and outer circles. Starting from

the upper left corner of iris the circular Hough transform is applied. This algorithm is used for each inner and outer circle separately.

Circular Hough Transform for Iris localization

A challenging, yet crucial step in the iris recognition process is iris segmentation. The circular Hough transform is used to detect the iris and pupil. First, preprocessing steps involving morphology and filtering takes place. Then, the outline of the eye is found using the Canny edge detector. The edge image is then transformed to parameter, or Hough

An iris recognition system is proposed here having four steps. First one, image segmentation which is achieved using Canny Edge Detector then iris Circular Hough transformation (CHT) is second step to localize the pupil and iris regions. In third step segmented iris is normalized and features are extracted using standard symlet wavelet 4.
