Genetic Control Of Insect Pests

Genetic control involves manipulation of genetic material of a pest species so as to confer lethality on the species. It is also called autocidal control. Inherited Sterility Inherited sterility is an approach to the genetic manipulation of a pest population in which the reared and released insects are fertile but their progenies are sterile.

Genetic control is a form of biological control of pest species which exploits the insect's mate-seeking expertise to introduce genetic abnormalities (typically, but not necessarily, dominant lethal mutations) into the eggs of the wild population. The effectiveness of radiation-sterilized males depends on the mating competitiveness of released males being adequate in relation to the recovery potential of and rate of immigration into the target population.

Genetic Control of Insect Pests focuses on laboratory and field trials of genetic control methods of insects, which entails the use of insects to control themselves. It particularly describes species-specific and non-polluting genetic methods that have the advantage over most other methods of being efficient when the target insect is in low density, as the released insects have the capacity to search out the wild populations.

Just like chemical control, biological control is constantly under development because new pest organisms (insects, fungi, bacteria) appear and organisms mutate.

How to control pests and diseases? Biological vs. chemical

...

Biological pest control is a method of controlling pests such as

insects and mites by using other organisms. It relies on predation, parasitism, herbivory or other natural mechanisms, but typically also involves an active human management role. Classical biological control involves the introduction of natural enemies of the pest that are bred in the laboratory and released into the environment.

Pest control - Wikipedia

This book deals with a completely new concept in insect control, i.e. the use of insects to control themselves. These genetic control methods are species specific and non-polluting, being most efficient when the target insect has a low density. However, they are least efficient against those insects with a high reproductive potential. Various topics are dealt with in 9 chapters, including...
