Heat Transfer. by Ron Kurtus (revised 16 January 2019) Heat transfer is the transfer of thermal energy from one object or system to another, thus changing the temperature of each object. This process changes the thermal energy of both systems involved until thermal equilibrium is reached.. Thermal energy can be transferred within a given material or from one material to another through conduction.

Put water in the pan, then turn on the heat. As the pan gets hot, some of that heat transfers to the molecules of water sitting on the bottom of the pan via conduction. That speeds up the motion of those water molecules — they are warming. Lava lamps illustrate heat transfer via convection: Waxy blobs get warmed at the base and expand.
