The G Factor The Science

The g factor can be derived from a correlation matrix of mental ability tests by many different methods of factor analysis. A g factor always emerges provided that the test battery is sufficiently large and diverse. The only exception is when one uses orthogonal rotation which

precludes the appearance of a g factor.

The G Factor: The Science of Mental Ability - Arthur ...

A g-factor is a dimensionless quantity

that characterizes the magnetic moment and angular momentum of an atom, a particle or the nucleus. It is essentially a proportionality constant that relates the observed magnetic moment μ of a particle to its angular momentum quantum number and a unit of magnetic moment, usually the Bohr magneton or nuclear magneton.

g-factor (physics) - Wikipedia

The g factor is important because it is a major node in a complex network of educationally, socially and economically important variables ("the g nexus"). Jensen believes that a person's level of g is a threshold variable, and that above a certain

threshold other, non-g abilities and talents, including personality differences, are critical for educational and vocational success.

The g Factor: The Science of Mental Ability

The answer is, resoundingly, a yes. For example, the celebrated 2007 paper by Ian Deary and colleagues looking at the association between the g factor and educational achievement found that there was a 0.72 correlation between g and students' Best 8 GCSE scores, and a 0.69 correlation between g and GCSE total points score

The g factor - The

science of human intelligence

General intelligence, also known as g factor, refers to the existence of a broad mental capacity that influences performance on cognitive ability measures. Charles Spearman first described the existence of general intelligence in 1904. According to Spearman, this g factor was responsible for overall performance on mental ability tests.

What Is General Intelligence (G Factor)?

The g factor is about individual differences in mental abilities. In factor analyses of any and every large and diverse collection of measures of mental abilities, however varied the content of

knowledge and skills they call upon, g emerges as the largest, most general source of differences between individuals and between certain subpopulations.

In general, g loadings were computed by submitting a correlation matrix to a principal-axis factor analysis and using the loadings of the subtests on the first unrotated factor. In some cases g loadings were taken from studies where other procedures were followed; these procedures have been shown empirically to lead to highly comparable results (Jensen & Weng, 1994).
