There are myriad different types of phase transformations that occur in metals, some very complex, but they can be divided into two general groups, both of which are encountered in Nitinol: Diffusional transformations are those in which the new phase has a different chemical composition

than the extant parent phase. Because it is compositionally different than its surroundings, the new phase can only be formed by transporting atoms over relatively long distances—for example, the ...

Mechanisms of Diffusional Phase Transformations in Metals and Alloys is devoted to solid-solid phase transformations in which elementary atomic processes are diffusional jumps, and these processes occur in a series of so-called nucleation and growth through interface migration. Instead of relying strictly on a pedagogical approach, it documents the evolution of phase transformation concepts.
