The below-mentioned formula represents one-way Anova test statistics. The result of the ANOVA formula, the F statistic (also called the F-ratio), allows for the analysis of multiple groups of data to determine the variability between samples and within samples. The formula for one-way ANOVA test can be written like this:

Introduction to ANOVA for Statistics and Data Science

In this Lesson, we introduce Analysis of Variance or ANOVA. ANOVA is a statistical method that analyzes variances to determine if the means from more than two populations are the same. In other words, we have a quantitative response variable and a categorical explanatory variable with more than two levels. In ANOVA, the categorical explanatory is typically referred to as the factor.

Lesson 10: Introduction to ANOVA | STAT 500

In order to perform a one-way ANOVA test, there are five basic assumptions to be fulfilled: Each population from which a sample is taken is assumed to be normal. All samples are randomly selected and independent. The populations are assumed to have equal standard deviations (or variances).

One-way ANOVA is a test for differences in group means. One-way ANOVA is a statistical method to test the null hypothesis (H_0) that three or more population means are equal vs. the alternative hypothesis (H_a) that at least one mean is different.

Using the formal notation of statistical hypotheses, for k means we write: $H_0: \mu_1 = \mu_2 = \dots = \mu_k$

Analysis of variance (ANOVA) is a statistical technique that is used to check if the means of two or more groups are significantly different from each other. ANOVA checks the impact of one or more factors by comparing the means of different samples. We can use ANOVA to prove/disprove if all the medication treatments were equally effective or not.
