are called parametric equations and  $t$  is called the parameter. The set of points  $(x, y)$  obtained as  $t$  varies over the interval  $I$  is called the graph of the parametric equations. The graph of parametric equations is called a parametric curve or plane curve, and is denoted by  $C$ .

Unit 10 - Parametric and Polar Equations - Classwork Until now, we have been representing graphs by single equations involving variables  $x$  and  $y$ . We will now study problems with which 3 variables are used to represent curves. Consider the path followed by an object that is propelled into the air at an angle of  $45^\circ$ .

This results in two equations, called parametric equations. Let  $f$  and  $g$  be continuous functions (functions whose graphs are unbroken curves) of the variable  $t$ . Let  $f(t) = x$  and  $g(t) = y$ . These equations are parametric equations,  $t$  is the parameter, and the points  $(f(t), g(t))$  make up a plane curve.

About this unit. We are used to working with functions whose output is a single variable, and whose graph is defined with Cartesian, i.e.,  $(x, y)$  coordinates. But there can be other functions! For example, vector-valued functions can have two variables or more as outputs!

One of the two parametric equations is solved for  $t$  and then it is substituted into the other equation. Here the first equation yields:  $tx = 0.5$  If this is substituted into the second equation, then the result is the equation:  $yx = -10.5$  This is the formula for the dotted line in the figure.  $(0, 1) \cdot (2, 0) \cdot (4, -1)$   $y = x$
