Local Theory Of Banach Spaces

It turns out that many global properties of Banach spaces can be learned from properties of finite dimensional substructures, and this is what we mean by "local". Of course, this means that we have to start caring about finite dimensional spaces. In finite dimensional spaces, all norms on $\mathbb{R}^n$ are equivalent. If $\|\cdot\|$ is a norm on $\mathbb{R}^n$, we can associate the

In Banach space theory, the principle of local reflexivity (see [1]) says that every Banach space E has the following property: $B(L, E^{**}) = B(L, E)^{**}$ for any finite-dimensional Banach space L . So it is natural to give the following definition.

Basic examples of Banach spaces include: the L^p spaces and their special cases, the sequence spaces ℓ^p that consist of scalar sequences indexed by $\mathbb{N}$; among them, the space ℓ^1 of absolutely summable sequences and the space ℓ^2 of square summable sequences; the space c_0 of sequences tending to zero and the space ℓ^∞ of bounded sequences; the space $C(K)$ of continuous scalar functions on a compact Hausdorff space K , equipped with the max norm,

Every normed space is a Hausdorff locally convex space, and much of the theory of locally convex spaces generalises parts of the theory of normed spaces. The family of seminorms can be taken to be the single norm. Every Banach space is a complete Hausdorff locally convex space, in particular, the L^p spaces with $p \geq 1$ are locally convex.

Completions. Every normed space can be isometrically embedded onto a dense vector subspace of some Banach space, where this Banach space is called a completion of the normed space. This completion is unique up to isometric isomorphism. More precisely, for every normed space X , there exist a Banach space Y and a mapping $T : X \rightarrow Y$ such that T is an isometric mapping and $T(X)$ is dense in Y .

Asymptotic theory of finite dimensional spaces is part of what is known as the Local Theory of Banach spaces, which relates the structure of an infinite dimensional Banach space to the structure of its lattice of finite dimensional subspaces. There are several books which deal with this subject (see e.g. [60]).

Geometry and Martingales in Banach Spaces provides a compact exposition of the results explaining the interrelations existing between the metric geometry of Banach spaces and the theory of martingales, and general random vectors with values in those Banach spaces. Geometric concepts such as dentability, uniform smoothness, uniform convexity, Beck convexity, etc. turn out to characterize asymptotic behavior of martingales with values in Banach spaces.
