Transient tachypnea of the newborn is a clinical diagnosis and radiographs of the chest are primarily performed in these infants to exclude other causes of respiratory distress. On imaging, the lungs are well inflated. Symmetrically prominent interstitial opacities radiating from the hila are most commonly seen (Fig. 6). Diffuse fine granular opacities may be present bilaterally and can be confused with RDS if attention is not paid to the patient's gestational age and the degree of inflation.
