As to the critical generating rate of traffic flow, Wu et al. have proposed a new dynamic traffic model to determine the critical traffic generation rate in the scale-free network. Although these rules and algorithms are aimed at avoiding or reducing link overload by a judicious route searching strategy, all of these works do not consider the real urban traffic behavior, namely, the choice behavior of individual is based on the cost of the links which is assessed as a monotonically ...

Predicting urban traffic is of great importance to intelligent transportation systems and public safety, yet is very challenging because of two aspects: 1) complex spatio-temporal correlations of urban traffic, including spatial correlations between locations along with temporal correlations among timestamps; 2) diversity of such spatio-temporal

correlations, which vary from location to location and depend on the surrounding geographical information, e.g., points of interests and road networks.

Model-1 is based on the rationale that a traffic flow propagates along successive links in a traffic network, and the flow thus has spatiotemporal characteristics. It has been shown in that utilizing traffic amount of the nearest upstream links helps improve the prediction accuracy, but those of distant neighbouring links do not affect it. Therefore, Model-1 considers the spatial correlation between the concerned link and each of its direct upstream links.
