In physics, aether theories propose the existence of a medium, a space-filling substance or field, thought to be necessary as a transmission medium for the propagation of electromagnetic or gravitational forces. Since the development of special relativity, theories using a substantial aether fell out of use in modern physics, and are now joined by more abstract models. This early modern aether has little in common with the aether of classical elements from which the name was borrowed. The assort

Aether theories - Wikipedia

Modern quantum physics predicts that the vacuum of space is teeming with normally undetectable 'zero-point' energy, in the form of electromagnetic radiation fields (the zero-point field) and short-lived 'virtual' particles (the 'Dirac sea'). This 'quantum vacuum' is similar in some respects to the ether.
